PRODUCTION CHARTS

New primocane variety of raspberry introduced in the *Easy* group, as it is extremely easy to pick.

Another peculiarity is the light and bright color, to which we owe the *Star* suffix, which is maintained even after the harvest.

The consistency of the fruit also facilitates the shelf life and harvest yields, which arrives in the spring production to 8.5 kg / h, as an average of the entire cycle.

Interesting is also the production in the second longcane cycle: in this case, the harvest time is medium.

The plant has medium vigor and is very performing in the primocane production due to the high ability to flower on the new vegetation starting already from 80 days after transplantation and then continue maintaining however a good vegetative balance: the autumn harvest is therefore to be considered early.
