

The number of plants per linear meter, with a distance of two meters between the rows is:

- **AUTUMN CYCLE**
three/four plants /ml
- **SPRING CYCLE**
two plants /ml

as it is very high the bud breaking and their vigor.

A medium-early transplantation period is recommended.

*Vegetable patent registered.
Multiplication prohibited.*

EasyRock

ALEL111

The Strength

EasyRock

ALEL111

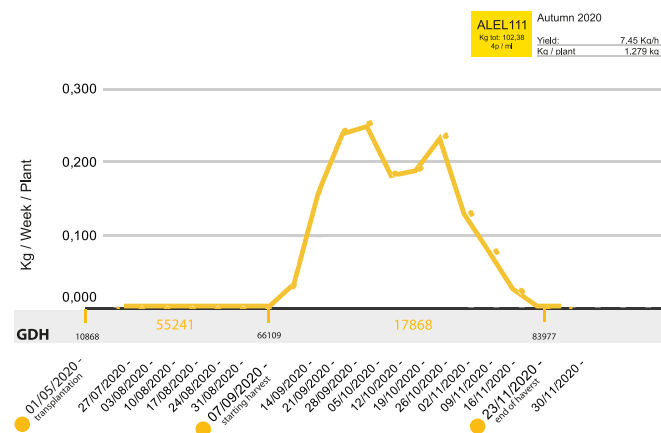

The Strength

New variety of primocane raspberry characterized by an extremely ease of picking and cultivation, therefore belonging to the *Easy* group.

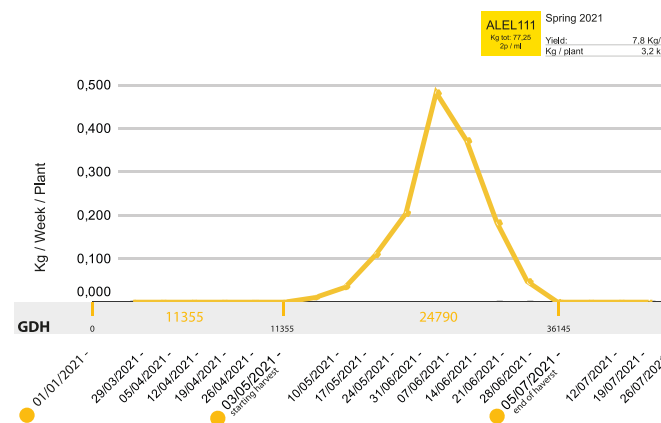

The suffix *Rock* derives from the medium-high vigor that characterized erect plants, good rooting and high resistance to fungal pathogens.

PRODUCTION CHARTS

The autumn production is concentrated on the terminal part of the plant and consequently the harvest period in this cycle is medium-late.

Spring production is very high in quantity (more than 3 kg/ per plant) and as harvesting yields, deriving from the characteristics of the fruit, but also from the vegetative habitus.

The picking of the fruit is facilitated and together with its consistency and the vegetative habitus, make the harvesting yields very high, reaching in spring 7.5 kg/h as the average throughout the cycle.
